PREFACE.

This collection at the present date — January 1, 1894 — consists of 573 species, 5002 sets and 20,388 eggs. It was the desire of its owners to procure full and complete series rather than to obtain new species, hence the large number of sets in proportion to the number of species.

It is especially strong in series of Warblers, Hawks, and Owls, to which particular attention is invited. No effort has been made to obtain the eggs of the Water Birds as it is practically impossible to secure a good representation of them.

Ridgway's Nomenclature has been retained as far as possible, as the collection was already numbered and arranged in accordance with it long before the A. O. U. Nomenclature was published.

Groove-billed Crotophaga

laid with blotches and specks of light chestnut and on two eggs a very few spots of a darker brown or umber. All more or less inclined to form wreathes at larger end. Sizes: 73x57; 70x56; 72x56; 69x54; 72x56. Type of markings is very similar to some sets of Black and White Warbler but eggs are smaller and more pointed than that species. The set is now in the fine collection of Mr. W. A. Davidson of Detroit, Mich. I might also mention the finding of nests of Hooded and Cerulean Warbler the same day. The former is becoming quite common here.

ERNEST H. SHORT,
Albion, N. Y.

Queries Answered.

In answer to *Patronus Avium* who asks the questions in your September number would say:

1st. Birds have but a single eyelid, as with most mammals, but they are provided with a nictating membrane beneath the regular eyelid. Many species have two membranes making three eyelids if you wish to call them so.

2d. The wishbone (clavicles joined) is the better form of bony framework to get a good wing action from the use of the pectoral muscles.

3d. All the Phalaropes fly, run and swim with ease and perfect grace. There are others, but none better adapted than these in America.

4th. The Great Crested Flycatcher and Blue Grosbeak place cast-off snake skins in their nests; the former in about four instances in five; the latter not as often. Other birds have this peculiarity but not regularly.

5th. Do as you like; but if you adopt a style follow it exactly and give the Roman pronunciation: æ as i; i as e; e as a; a as ah; v as w, etc. Better to adopt the English.

6th. The Wilson's Phalarope (female)

is in my opinion the handsomest bird in America (not gaudy). It combines perfection in coloration and blending, and as well, necessary to beauty, perfect symmetry and grace in every movement. The Blue Jay is the most intelligent bird, or perhaps the Canada Jay, or else the Black-billed Magpie or Crow. One of these four and I prefer to name the Jay.

7th. A matter of opinion with us no need of discussion.

8th. Albinism to any extent is a variation and hence an abnormality, but it is not a disease, for loss of pigment in shell or feather may be in evidence and the bird remain in perfect health.

9th. Have repeatedly observed parent-birds cover their eggs or young with spreading wings during a rain storm.

10th. Have never seen Goat-suckers transport their eggs, but believe that they do do it in some manner. If Audubon says so, it is so. In-so-far as I have followed the great observer he is always correct; certainly truthful.

TITUS ANDRONICUS ORNIS MATERUS,
Oozamalak.

A Collecting Ladle.

On the 11th of Junn, '92, I had the good fortune to find a Yellow-billed Cuckoo's nest, but the nest was situated on a branch limb of a willow tree, which limb of course would split off very easily, so I contrived an apparatus, which consisted of a baking powder box cover tacked on to the end of an 8 ft. stick, thus making a crude ladle, then climbed the tree, reached out with my primitive ladle, and in a few seconds had a set of five slightly incubated eggs. This idea may be useful to collectors.

E. H. FLETCHER,
Brockton, Mass.
